- Specifically designed for the agricultural market
- · Solid ceramic plungers
- · Optimized inlet and outlet valves
- · Dual lip oil seal
- · Dual shaft configurations
- · Smooth shaft available
- Cast iron manifold with aluminum valve covers
- "HR" high resistance anti-corrosion treatment on manifold

SPECIFICATIONS

Pump Model	AB90DP	AB100DP	AB120DP	AB180DP	
Maximum Volume	23.8 GPM	26.4 GPM	31.7 GPM	47.6 GPM	
Maximum Discharge Pressure	870 PSI				
Horsepower	14.0 HP	15.6 HP	18.7 HP	28.1 HP	
Maximum Pump Speed	650 RPM	550 RPM	550 RPM	650 RPM	
Maximum Inlet Pressure	45 PSI				
Plunger Bore	1.42 in. / 36 mm	1.57 / 40 mm	1.78 in. / 45 mm	1.97 in. / 50 mm	
Plunger Stroke	1.78 in. / 45 mm				
Oil Capacity	77.8 oz.				
Inlet Port Thread	1-1/2" BSPP				
Discharge Port Thread	1" BSPP				
Shaft Diameter	1.375 ASAE - DUAL				
Weight	90.4 lbs.				
Dimensions	17.48" x 17" x 8.29"				

Instructions and Recommendations for the Installation of

AB Series Pumps

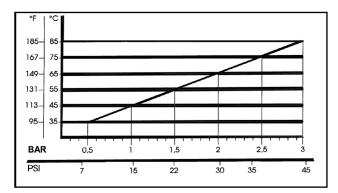

In order to obtain maximum performance in terms of duration of seals and valves, it is necessary to respect a few simple rules, as follows:

1) In order to avoid damage caused by cavitation, the pump must be pressure fed.

The higher the inlet pressure, the longer the life of the wet end of the pump.

When working at 185°F (85°C), the minimum feed pressure - measured directly in the inlet port of the pump when it is working - is 45 psi (3 bar).

The minimum feed pressure according to the different temperatures are:

Naturally, if the application allows for feeding the pump with 45 psi (3 bar) even at low temperatures (for example: 115°F/45°C the life of the wet end of the pump will be even longer.

- 2) The plumbing which feeds the pump must be of a diameter at least equal to the inlet port. Also, follow the suggestions below:
 - a) Make the plumbing as short and straight as possible, preferably in an upward direction to facilitate the expulsion of eventual air bubbles naturally if compatible with the requirements of the system.
 - b) It is always useful to put a filter at the inlet with capacity of 4 to 5 times the flow of

the pump, for example for a 4 gpm (15 l/min) pump, put a filter from 16 to 20 gpm (60-75 l/mi)The mesh size suitable for this application is 0.016" (.4 mm).

c) It is extremely important to put a pressure switch on the suction port of the pump, and in any case downstream from the filter, so that it can stop the pump should the feed pressure drop by 20% due to the filter clogging or failure of the feed pump, etc.

3) Change of oil

We recommend the *first oil change after the first 50 hours*, with the *pump stopped* and the *oil still warm*.

This change is not recommended because the oil has lost its properties, but rather to eliminate the impurities that have gotten into the oil during the running-in phase. If these impurities are not removed, but are allowed to remain in the oil, they may cause premature wear to the moving parts and the oil seals. After this initial change, the oil can then be changed every three months or 300 hours of operation thereafter.

Please note: If the pump works in conditions with high humidity and with sharp temperature changes, it is possible that condensation will appear inside the crankcase, which mixing with the oil can change its properties. This is easy to see because the oil changes to a white, milky color.

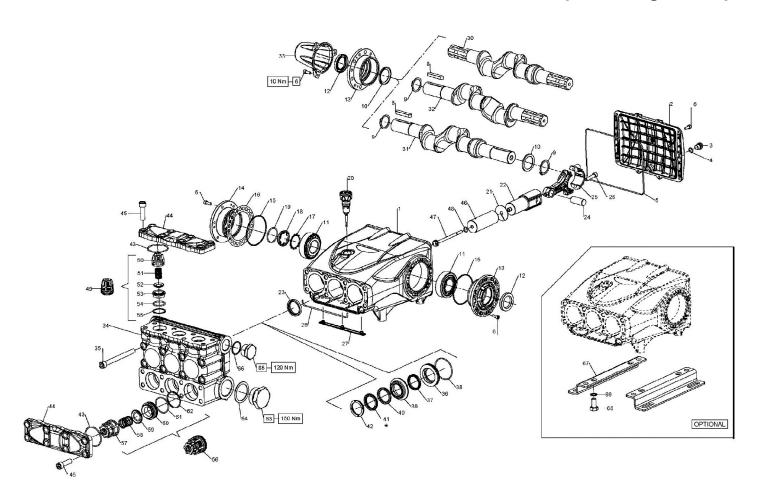

If the pump does not have excessive water leaking from the packings, and the oil becomes milky, the oil has to be changed more frequently. The percentage of water in the oil must not exceed 20%.

Use oil per the following chart:

*Decrease torque by 20% if threads are lubricated.

**Use Loctite 542 Red

DIMENSIONS

A suitably-calibrated over pressure valve must be installed, as well as the pressure regulating valve, must be installed on the high-pressure line.

The high-pressure pipes must be correctly sized for the system's maximum working pressure and used exclusively withing the working pressure range indicated by the pipe manufacture and marked on the pipe itself.

The ends of the high-pressure pipes must be sheathed and secured to a solid structure, so as ti avoid the risk of whiplash if the connections burst or break.

The pump transmission systems (joints, pulleys, belts, rotary shafts), must be suitably covered by a protective case.

If in doubt, do not hesitate to call the Interpump Group / General Pump Customer Service.
